Career Profile

Built and scaled a 24/7 customer operations function for an enterprise AI platform in autonomous industrial operations: SLA frameworks, incident response, and GTM pricing analysis for 20+ enterprise customers including Shell, BP, Chevron, Repsol, Petrobras, Pluspetrol, and E.ON.

Also led the buildout and deployment of the AI platform behind that function, integrating tickets, documentation, telemetry, code, and logs to automate first response, speed up issue investigation, and improve operational reliability.

Work Experience

present **Korial (formerly Energy Robotics), Darmstadt, Germany**

Jan-2022 Joined at ~20 employees; now ~100+ · Enterprise AI platform for autonomous industrial operations · Global

Head of Customer Support

Progressed from Robot Operations Engineer → Operations Project Manager → Head of Customer Support

- Built and scaled a 24/7 global customer operations function from 1 to 11 across Europe and the Americas, with capacity planning and capability development for 2,300+ customer tickets across a live fleet of ~100 safety-critical inspection robots across EMEA, APAC, and the Americas.
- Led the buildout and deployment of the AI operations platform that serves as the operational control plane for customer support, incident response, and fleet reliability, integrating 9,300+ Jira tickets, 1,570 Confluence pages, live fleet telemetry, code repositories, and SSH diagnostics through hybrid vector and knowledge-graph retrieval to automate first replies, accelerate investigation, and surface 80+ anomalies per week; governed by an 8-dimension evaluation harness, per-category copilot-to-autopilot graduation gates, and a CSAT kill switch. Now in Argilla-supervised human-in-the-loop evaluation, scheduled for customer-facing release.
- Designed the operating model from zero: incident framework (Sev-1 to Sev-4), Gold/Silver/Bronze SLAs, on-call rotation, escalation paths, and post-incident reviews.
- Achieved average first-response time of 0.4h across the full support queue (improved 3.5x in six weeks through AI-assisted triage and automation); maintained SLA commitments for a global portfolio of 20+ enterprise customers across oil & gas, utilities, and industrial services, including Shell, BP, Chevron, Repsol, Petrobras, Pluspetrol, and E.ON.
- Led the commercial analysis underpinning the company's GTM support pricing model: multi-scenario P&L modelling across SLA tiers, staffing models (Europe-only vs. Follow-the-Sun), and labour cost structures — directly informing pricing decisions and preventing launch of an unprofitable service tier.
- Drove cross-functional prioritisation across Engineering, Product, Sales, and Finance, using toil rate, knowledge-base debt, avoidable escalations, and engineering wait-time accountability to steer automation, documentation, and support model investment.

- Dec-2021 **Magazino GmbH, Munich, Germany**
- Nov-2018 Robotics scale-up (autonomous mobile robots for intralogistics) · Acquired by Jungheinrich
Robot Software Engineer → Lead Robot Engineer
- Led deployment and scaling of autonomous mobile robots in live customer environments, transitioning systems from pilot setups to production-scale operations.
 - Drove the first TORU customer project from a 3-robot pilot to a fully autonomous system handling 15,000+ orders per week.
 - Acted as technical interface between customers and engineering, translating operational feedback into product and reliability improvements.
- Oct-2018 **ASTI Mobile Robotics, Burgos, Spain**
- Nov-2016 Industrial robotics company specialising in AGVs · Acquired by ABB
Control and Automation Engineer
- Designed and deployed AGV control software across manufacturing, food processing, and logistics environments.
 - Contributed to modernization of development practices, introducing version control, coding guidelines, and Kanban-based workflows.
- Sep-2016 **INDA S.L, Zaragoza, Spain**
- Sep-2015 Early-stage UAV startup · **R&D Engineer** · Electrical hardware and embedded software for UAV prototypes.

Education

- 2005–2013 **MEng Industrial Engineering,**
Engineering and Architecture School, Universidad de Zaragoza, Zaragoza, Spain
 Specialisation in Automation and Robotics.
- 2011–2013 **Final year project,**
Modeling and simulation of a Robucar TT robot, Aragón Institute of Engineering Research, Zaragoza, Spain
 Gazebo/ROS simulator in C++.
- 2010–2011 **Erasmus Exchange Program,**
Tekniska Högskolan, Linköpings Universitet, Linköping, Sweden

Languages

Spanish	Native	
English	Fluent	<i>Cambridge English: Advanced (CAE)</i>
German	Upper-Intermediate	<i>B2 Goethe-Zertifikat</i>

Technical Environment

· Python · Docker · Linux · Jira · Confluence · LLM/RAG tooling (Qdrant, LiteLLM, Langfuse) · Knowledge graphs (FalkorDB) · Workflow automation (n8n) · ROS (field operations and debugging)

Projects

- opsflow Personal project: AI-native investigation platform for technical operations. Converges tickets, alerts, and events into entity-aware investigations with hybrid retrieval and policy-bounded governance. Alpha, in active development. github.com/cgracia/opsflow
- writeflow Personal project: multi-agent writing pipeline. Nine specialist agents (strategist, writer, six parallel reviewers, synthesiser) collaborate through a structured workflow to produce professional communication. Working prototype. github.com/cgracia/writeflow
